Leads Global ERP — Final Version

Short guide in simple English · Built from the client's latest reference (V8.7) · Data in this guide is fictional

Important — please read. This is a **demonstration** that works in one web browser on one computer. The data is saved inside that browser. It is **not secure**, **not shared** between people, and has **no login or user roles**. It can be lost if the browser's data is cleared. Please do not type real passport, QID or bank details into it. Use *Download backup* often.

1. What it does

The ERP manages recruitment for three divisions. Each division has its own steps, its own forms and its own dashboard. Every number on a dashboard is **calculated from the records that were entered** — nothing is typed in by hand.

To open it: double-click `index.html` in the folder `Leads_Global_ERP_Final`. No installation and no internet are needed.

2. The three divisions and their workflows

Blue-Collar
Client → Order → Overseas Agency → Agency Allocation → Candidate → Recruitment Stages → Interview → QVC → RTP → Visa → Ticket → Arrival → Deployment → Handover → Accounts

Domestic
Sponsor → Worker Requirement → Worker Registration → Recruitment Progress → Ticket / Arrival → Sponsor Handover → 9-month Warranty → Complaint / Replacement / Refund

Corporate
Company → Job Requirement → Candidate → Interview → Selection → Offer → Joining → Placement Fee / Accounts

The divisions are kept apart. A Domestic worker cannot be given a Blue-Collar stage such as *Deployed*, and a Blue-Collar record cannot be linked to a Domestic sponsor.

3. The modules (menu items)

Module	What it is for
Clients / Sponsors / Companies	Who the work is for. Duplicate names are blocked.
Orders / Worker Requirements / Job Requirements	What is needed: trade, number of people, salary, conditions (different fields in each division).
Overseas Agencies, Agency Allocations *(Blue-Collar)*	Which agency supplies how many people for which order, and the fee for each deployed worker.
Candidates / Workers	The people being recruited, with their current stage and key dates.
Daily Updates & Follow-ups	The daily work log. **This is how a candidate moves to the next stage.**

Interviews · Tickets & Deployment	Interview results; flight and ticket details.
Domestic Warranty (9 months)	Warranty for each handed-over worker, with complaint, replacement and refund tracking.
Documents	Upload and download files (PDF, picture, Word) up to 5 MB.
Accounts & Collections	Invoices, payments received, expenses, refunds, deposits.
Reports · Import / Export · Settings & Backup · Audit log	Live reports, CSV import/export, backup and restore, record of every change.

4. How to enter data

1. **Choose the division** in the left menu.
2. Add the **client / sponsor / company**, then the **order** (requirement).
3. Blue-Collar only: add the **agency** and an **allocation** (agency + order + quantity + fee per deployed worker).
4. Add the **candidates**. Each one starts at *CV Received*.
5. Every day, record **Daily Updates**: pick the candidate, the date, the new stage, who did the work, what was done, and the next follow-up with its due date. The system then **moves the candidate**, fills the matching date (for example, Deployed fills the *verified deployment date*), and keeps the full history.
6. Add interviews, tickets, documents and payments as they happen.

The forms check your entries: required fields, valid dates, numbers, links to existing records, and duplicates. Mistakes are shown under the field. A record that other records depend on cannot be deleted.

5. How statuses and numbers are calculated

Item	Rule
Stage counters	**Current**: candidates who are at that stage now. **(Ever reached)**: candidates who were at that stage at any time.
Verified deployment	A daily update to *Deployed* sets the verified deployment date. Only these workers count for agency fees.
Agency fee earned	Verified deployed workers × the fee in the allocation.
Agency fee outstanding	Earned minus payments linked to that allocation. The system warns if more workers are deployed than were allocated.
Warranty start	The sponsor handover date. A daily update to *Handed Over* records it and **creates the warranty automatically**.
Warranty end	Start + 9 months (calendar months; 31 May + 9 months = 28 February). It is always calculated, never typed.
Warranty active / expired	Active while the end date is today or later (the end date is the last covered day). Expired after that. "Expiring soon" = 30 days or less left.
Open complaint	A complaint reason is recorded and the claim is not *Resolved*.
Corporate placement fee	0.5 month, 1 month, or a custom amount, using the candidate's salary. Earned when the candidate has *Joined*. Due date = joining date + the months set on the job requirement. Outstanding = fee − payments received.

Follow-up	The next action of a candidate's latest update. It is overdue when its due date has passed.

6. Where the dashboard numbers come from

- **Counts** (clients, orders, candidates, interviews, tickets, documents): the number of saved records.
- **Stage cards and the division table**: candidates grouped by their current stage; "—" means that stage does not exist in that division.
- **Money cards**: calculated from allocations, verified deployments, placement fees and the payments entered in Accounts.
- **Warranty cards**: calculated from today's date and each warranty's end date and complaint.
- **Alerts (bell icon)**: overdue follow-ups, open complaints, warranties ending soon, overdue fees — all live.

Click any card to see exactly which records make up the number. (Tested: 34 of 36 clickable cards match their list exactly; the other two are totals of quantities and open the source orders.)

7. Backup, import and export

- **Backup / Restore** (Settings): one JSON file with all records, history and uploaded documents. A backup from another project, or a damaged file, is refused.
- **CSV import**: download the template, fill it, upload it. You see a preview first — which rows will be added, which are duplicates, which are rejected and why. Nothing is saved until you confirm.
- **CSV export**: every list and report can be exported.

8. Major limitations

- Single browser, single computer; no sharing, no login, no roles, no encryption — **not a secure or multi-user system**.
- Designed for hundreds of candidates. At about 2,000 candidates the data passes the browser's storage limit (about 5 MB).
- No connection to accounting, e-mail, SMS or government systems. No artificial-intelligence features.
- Tested in Chrome/Edge engines only. Not tested on Safari, Firefox or real phones.
- A real system needs a server database, sign-in, permissions, server-side checks, secure file storage and backups. The code is organised so these can be added (the storage part is separate), but they are **not built**.

9. Questions for the client (the system uses a safe default until answered)

1. Which of the 17 stages belong to each division? (A sensible set per division is used now.)
2. What exactly makes a deployment "verified"? (A daily update to *Deployed*.)
3. Must the warranty always start on the verified handover date, or can it be set separately? (Handover date by default; any difference is flagged.)
4. Is the last day of the warranty still covered? Which claim statuses are allowed? (Yes; Active, Open, Resolved, Expired.)
5. Corporate fee: confirm the basis options, when it is earned, and VAT. (Earned at joining; no VAT.)
6. Do Domestic or Corporate use overseas agencies? Do Blue-Collar or Corporate have a warranty? (No, as in the reference.)

7. Roles and security rules for the real system; old V6 modules (visits, demand letters, credentials, costing) — still needed?
